Abstract

Negativity is an entanglement measure applicable to thermal mixed states. Based on the numerical renormalization group (NRG) approach, we develop a method of computing the negativity between the impurity and the bath of a quantum impurity system. The computational cost is reduced exponentially by adopting the energy-scale separation structure of the NRG. We apply the method to the single-impurity Kondo model and the Anderson model, and find a power-law temperature dependence of the negativity near the Kondo-fixed point. The power-law exponent is 2, which is identical to the exponent \cite{1} of the entanglement of formation. \cite{1} S. S. B. Lee, J. Park, and H. S.
